This a safety alert symbol and should never be ignored. When you see this symbol on labels or in manuals, be alert to the potential for personal injury or death.

**CAUTION**

As with any mechanical equipment, personal injury can result from contact with sharp sheet metal edges. Be careful when you handle this equipment.

**NOTICE**

A thermostat is not included and must be ordered separately.
- The Lennox icomfort Touch™ thermostat must be used in communicating applications.
- In non-communicating applications, the Lennox ComfortSense® 7000 thermostat may be used, as well as other non-communicating thermostats.

In all cases, setup is critical to ensure proper system operation.

Field wiring for both communicating and non-communicating applications is illustrated in diagrams, which begin on Page 32.

**WARNING**

Improper installation, adjustment, alteration, service or maintenance can cause property damage, personal injury or loss of life. Installation and service must be performed by a licensed professional installer (or equivalent), service agency or the gas supplier.

The SLP98UHV category IV gas furnace is equipped with a variable-capacity, variable-speed integrated control. This control ensures compatibility with the Lennox icomfort Touch™ thermostat, the Harmony III™ zone control system, or a thermostat which provides humidity control. Each SLP98UHV is shipped ready for installation in the upflow, horizontal left air discharge or horizontal right air discharge position.

The furnace is equipped for installation in natural gas applications only. A changeover kit may be ordered for LP applications.

The SLP98UHV must be installed only as a Direct Vent gas furnace.

**NOTE** - In Direct Vent installations, combustion air is taken from outdoors and flue gases are discharged outdoors. See figure 2 for applications including roof termination.

Check equipment for shipping damage. If you find any damage, immediately contact the last carrier.

The following items may also be ordered separately:

1 - Thermostat
1 - Natural to LP gas conversion kit
1 - High altitude kit
1 - Horizontal suspension kit

---

**Danger of explosion.**

There are circumstances in which odorant used with LP/propane gas can lose its scent. In case of a leak, LP/propane gas will settle close to the floor and may be difficult to smell. An LP/propane leak detector should be installed in all LP applications.

**Safety Information**

**Warning**

Improper installation, adjustment, alteration, service or maintenance can cause property damage, personal injury or loss of life. Installation and service must be performed by a licensed professional installer (or equivalent), service agency or the gas supplier.

**Caution**

As with any mechanical equipment, personal injury can result from contact with sharp sheet metal edges. Be careful when you handle this equipment.

Use only the type of gas approved for use with this furnace. Refer to unit nameplate.

**Building Codes**

In the USA, installation of gas furnaces must conform with local building codes. In the absence of local codes, units must be installed according to the current National Fuel Gas Code (ANSI-Z223.1/NFPA 54). The National Fuel Gas Code is available from the following address:

American National Standards Institute, Inc.
11 West 42nd Street
New York, NY 10036

**Installed Locations**

In Canada, installation must conform with current National Standard of Canada CSA-B149 Natural Gas and Propane Installation Codes, local plumbing or waste water codes and other applicable local codes.

This furnace is designed for installation clearances to combustible material as listed on the unit nameplate and in the tables in figures 10 and 11. Accessibility and service clearances must take precedence over fire protection clearances.

**Note** - For installation on combustible floors, the furnace shall not be installed directly on carpeting, tile, or other combustible material other than wood flooring.

For installation in a residential garage, the furnace must be installed so that the burner(s) and the ignition source are located no less than 18 inches (457 mm) above the floor. The furnace must be located or protected to avoid physical damage by vehicles. When a furnace is installed...
in a public garage, hangar, or other building that has a hazardous atmosphere, the furnace must be installed according to recommended good practice requirements and current National Fuel Gas Code or CSA B149 standard.

**NOTE** - **NOTE** - Furnace must be adjusted to obtain a temperature rise (100% percent capacity) within the range(s) specified on the unit nameplate. Failure to do so may cause erratic limit operation and may also result in premature heat exchanger failure.

This SLP98UHV furnace must be installed so that its electrical components are protected from water.

**Installed in Combination with a Cooling Coil**

When this furnace is used with cooling units, it shall be installed in parallel with, or on the upstream side of, cooling units to avoid condensation in the heating compartment. With a parallel flow arrangement, a damper (or other means to control the flow of air) must adequately prevent chilled air from entering the furnace. If the damper is manually operated, it must be equipped to prevent operation of either the heating or the cooling unit, unless it is in the full HEAT or COOL setting. See figure 3.

**FIGURE 3**

When installed, this furnace must be electrically grounded according to local codes. In addition, in the United States, installation must conform with the current National Electric Code, ANSI/NFPA No. 70. The National Electric Code (ANSI/NFPA No. 70) is available from the following address:

National Fire Protection Association
1 Battery March Park
Quincy, MA 02269

**NOTE** - This furnace is designed for a minimum continuous return air temperature of 60°F (16°C) or an intermittent operation down to 55°F (13°C) dry bulb for cases where a night setback thermostat is used. Return air temperature must not exceed 85°F (29°C) dry bulb.

In Canada, all electrical wiring and grounding for the unit must be installed according to the current regulations of the Canadian Electrical Code Part I (CSA Standard C22.1) and/or local codes.

**CAUTION**

Do not set thermostat below 60°F (16°C) in heating mode. Setting thermostat below 60°F (16°C) reduces the number of heating cycles. Damage to the unit may occur that is not covered by the warranty.

The SLP98UHV furnace may be installed in alcoves, closets, attics, basements, garages, and utility rooms. This furnace is not designed for installation in mobile homes, recreational vehicles, or outdoors.

Never use an open flame to test for gas leaks. Check all connections using a commercially available soap solution made specifically for leak detection.

**Use of Furnace as Construction Heater**

Lennox does not recommend the use of SLP98UHV units as a construction heater during any phase of construction. Very low return air temperatures, harmful vapors and operation of the unit with clogged or misplaced filters will damage the unit.

SLP98UHV units may be used for heating of buildings or structures under construction, if the following conditions are met:

- The vent system must be permanently installed per these installation instructions.
- A room thermostat must control the furnace. The use of fixed jumpers that will provide continuous heating is not allowed.
- The return air duct must be provided and sealed to the furnace.
- Return air temperature range between 60°F (16°C) and 80°F (27°C) must be maintained.
- Air filters must be installed in the system and must be maintained during construction.
- Air filters must be replaced upon construction completion.
- The input rate and temperature rise must be set per the furnace rating plate.
- One hundred percent (100%) outdoor air must be provided for combustion air requirements during construction. Temporary ducting may supply outdoor air to the furnace. Do not connect duct directly to the furnace.
- The furnace heat exchanger, components, duct system, air filters and evaporator coils must be thoroughly cleaned following final construction clean-up.
- All furnace operating conditions (including ignition, input rate, temperature rise and venting) must be verified according to these installation instructions.
WARNING
Product contains fiberglass wool.
Disturbing the insulation in this product during installation, maintenance, or repair will expose you to fiberglass wool. Breathing this may cause lung cancer. (Fiberglass wool is known to the State of California to cause cancer.)
Fiberglass wool may also cause respiratory, skin, and eye irritation.
To reduce exposure to this substance or for further information, consult material safety data sheets available from address shown below, or contact your supervisor.
Lennox Industries Inc.
P.O. Box 799900
Dallas, TX 75379-9900

CAUTION
SLP98UHV unit should not be installed in areas normally subject to freezing temperatures.

These instructions are intended as a general guide and do not supersede local codes in any way. Consult authorities having jurisdiction before installation.
In addition to the requirements outlined previously, the following general recommendations must be considered when installing a SLP98UHV furnace:
- Place the furnace as close to the center of the air distribution system as possible. The furnace should also be located close to the chimney or vent termination point.
- When the furnace is installed in an attic or other insulated space, keep insulation away from the furnace.
- When the furnace is installed in an unconditioned space, consider provisions required to prevent freezing of condensate drain system.

WARNING
Do not connect the return air ducts to the back of the furnace. Doing so will adversely affect the operation of the safety control devices, which could result in personal injury or death.

WARNING
Do not install the furnace on its front or back. See figure 4.

FIGURE 4

Upflow Applications
The SLP98UHV gas furnace can be installed as shipped in the upflow position. Refer to figure 10 for clearances. Select a location that allows for the required clearances that are listed on the unit nameplate. Also consider gas supply connections, electrical supply, vent connection, condensate trap and drain connections, and installation and service clearances [24 inches (610 mm) at unit front]. The unit must be level from side to side. Unit may be positioned from level to 1/2" toward the front to aid in draining. See figure 5.
setting equipment

unit must be level side-to-side. unit may be positioned from level to 1/2” toward the front to aid in draining.

figure 6

slp98uhv applications which include side return air and a condensate trap installed on the same side of the cabinet (trap can be installed remotely within 5 feet) require either a return air base or field-fabricated transition to accommodate an optional iaq accessory taller than 14.5”. see figure 6.

figure 7

removing the bottom panel

screw

bottom panel

bottom cap
**FIGURE 8**

Optional Return Air Base (Upflow Applications Only)

**NOTE** - Optional side return air filter kits are not for use with return air base.

Both the unit return air opening and the base return air opening must be covered by a single plenum or IAQ cabinet. Minimum unit side return air opening dimensions for units requiring 1800 cfm or more of air (W x H): 23 x 11 in. (584 x 279 mm). The opening can be cut as needed to accommodate plenum or IAQ cabinet while maintaining dimensions shown. Side return air openings must be cut in the field. There are cutting guides stenciled on the cabinet for the side return air opening. The size of the opening must not extend beyond the markings on the furnace cabinet.

To minimize pressure drop, the largest opening height possible (up to 14 inches) is preferred.

---

**NOTE** - Units with 1/2 hp blower motor are equipped with three flexible legs and one rigid leg. The rigid leg is equipped with a shipping bolt and a flat white plastic washer (rather than the rubber mounting grommet used with a flexible mounting leg). See figure 9. **The bolt and washer must be removed before the furnace is placed into operation.** After the bolt and washer have been removed, the rigid leg will not touch the blower housing.

---

**WARNING**

Blower access panel must be securely in place when blower and burners are operating. Gas fumes, which could contain carbon monoxide, can be drawn into living space resulting in personal injury or death.

**WARNING**

Improper installation of the furnace can result in personal injury or death. Combustion and flue products must never be allowed to enter the return air system or air in the living space. Use sheet metal screws and joint tape to seal return air system to furnace. In platform installations with furnace return, the furnace should be sealed airtight to the return air plenum. A door must never be used as a portion of the return air duct system. The base must provide a stable support and an airtight seal to the furnace. Allow absolutely no sagging, cracks, gaps, etc. For no reason should return and supply air duct systems ever be connected to or from other heating devices such as a fireplace or stove, etc. Fire, explosion, carbon monoxide poisoning, personal injury and/or property damage could result.

</table>

*Front clearance in alcove installation must be 24 in. (610 mm). Maintain a minimum of 24 in. (610 mm) for front service access.
†Allow proper clearances to accommodate condensate trap and vent pipe installation.
‡For installations on a combustible floor, do not install the furnace directly on carpeting, tile or other combustible materials other than wood flooring.

FIGURE 10
Return Air -- Upflow Units

Return air can be brought in through the bottom or either side of the furnace installed in an upflow application. If the furnace is installed on a platform with bottom return, make an airtight seal between the bottom of the furnace and the platform to ensure that the furnace operates properly and safely. The furnace is equipped with a removable bottom panel to facilitate installation.

Markings are provided on both sides of the furnace cabinet for installations that require side return air. Cut the furnace cabinet at the maximum dimensions shown on page 2. Refer to Engineering Handbook for additional information.

Setting an Upflow Unit

When the side return air inlets are used in an upflow application, it may be necessary to install shims on the bottom of the furnace.

Horizontal Applications

The SLP98UHV furnace can be installed in horizontal applications with either right- or left-hand air discharge. Refer to figure 11 for clearances in horizontal applications.

FIGURE 11
Suspended Installation of Horizontal Unit

This furnace may be installed in either an attic or a crawl-space. Either suspend the furnace from roof rafters or floor joists, as shown in figure 12, or install the furnace on a platform, as shown in figure 13. A horizontal suspension kit (51W10) may be ordered from Lennox or use equivalent.

NOTE - Heavy-gauge sheet metal straps may be used to suspend the unit from roof rafters or ceiling joists. When straps are used to suspend the unit in this way, support must be provided for both the ends. The straps must not interfere with the plenum or exhaust piping installation. Cooling coils and supply and return air plenums must be supported separately.
NOTE - When the furnace is installed on a platform in a crawlspace, it must be elevated enough to avoid water damage and to allow the evaporator coil to drain.

Platform Installation of Horizontal Unit

1 - Select location for unit keeping in mind service and other necessary clearances. See figure 11.

2 - Construct a raised wooden frame and cover frame with a plywood sheet. If unit is installed above finished space, fabricate an auxiliary drain pan to be installed under unit. Set unit in drain pan as shown in figure 13. Leave 8 inches for service clearance below unit for condensate trap.

3 - Provide a service platform in front of unit. When installing the unit in a crawl space, a proper support platform may be created using cement blocks.

4 - Route auxiliary drain line so that water draining from this outlet will be easily noticed by the homeowner.

5 - If necessary, run the condensate line into a condensate pump to meet drain line slope requirements. The pump must be rated for use with condensing furnaces. Protect the condensate discharge line from the pump to the outside to avoid freezing.

6 - Continue with exhaust, condensate and intake piping installation according to instructions.

Return Air -- Horizontal Applications

Return air must be brought in through the end of a furnace installed in the horizontal position. The furnace is equipped with a removable bottom panel to facilitate installation. See figure 7.

Filters

This unit is not equipped with a filter or rack. A field-provided filter is required for the unit to operate properly. Table 1 lists recommended filter sizes.

A filter must be in place when the unit is operating.

NOTE - In upflow applications where side return air filter is installed on same side as the condensate trap, make sure that clearance is maintained to ensure future access to the filter access panel.

</tr>
<tr>
<td>D Cabinet (24-1/2&quot;)</td>
<td>16 X 25 X 1 (1)</td>
</tr>
</tbody>
</table>
Duct System

Use industry-approved standards to size and install the supply and return air duct system. This will result in a quiet and low-static system that has uniform air distribution.

**NOTE** - Operation of this furnace in heating mode (indoor blower operating at selected heating speed) with an external static pressure which exceeds 0.8 inches w.c. may result in erratic limit operation.

Supply Air Plenum

If the furnace is installed without a cooling coil, a removable access panel should be installed in the supply air duct. The access panel should be large enough to permit inspection (by reflected light) of the heat exchanger for leaks after the furnace is installed. If present, this access panel must always be in place when the furnace is operating and it must not allow leaks into the supply air duct system.

Return Air Plenum

Return air must not be drawn from a room where this furnace, or any other gas-fueled appliance (i.e., water heater), or carbon monoxide-producing device (i.e., wood fireplace) is installed. When return air is drawn from a room, a negative pressure is created in the room. If a gas appliance is operating in a room with negative pressure, the flue products can be pulled back down the vent pipe and into the room. This reverse flow of the flue gas may result in incomplete combustion and the formation of carbon monoxide gas. This toxic gas might then be distributed throughout the house by the furnace duct system.

Return air can be brought in through the bottom or either side of the furnace. If a furnace with bottom return air is installed on a platform, make an airtight seal between the bottom of the furnace and the platform to ensure that the unit operates properly and safely. Use fiberglass sealing strips, caulking, or equivalent sealing method between the plenum and the furnace cabinet to ensure a tight seal. If a filter is installed, size the return air duct to fit the filter frame.

Pipe & Fittings Specifications

All pipe, fittings, primer and solvent cement must conform with American National Standard Institute and the American Society for Testing and Materials (ANSI/ASTM) standards. The solvent shall be free-flowing and contain no lumps, undissolved particles or any foreign matter that adversely affects the joint strength or chemical resistance of the cement. The cement shall show no gelation, stratification, or separation that cannot be removed by stirring. Refer to table 2 for approved piping and fitting materials.

### TABLE 2
**PIPING AND FITTINGS SPECIFICATIONS**

| Schedule 40 PVC (Pipe)          | D1785 |
| Schedule 40 PVC (Cellular Core Pipe) | F891  |
| Schedule 40 PVC (Fittings)      | D2466 |
| Schedule 40 CPVC (Pipe)         | F441  |
| Schedule 40 CPVC (Fittings)     | F438  |
| SDR-21 PVC or SDR-26 PVC (Pipe) | D2241 |

| PVC Solvent Cement | D2564 |
| CPVC Solvent Cement | F493  |
| ABS Solvent Cement | D2235 |
| PVC/CPVC/ABS All Purpose Cement For Fittings & Pipe of the same material | D2564, D2235, F493 |
| ABS to PVC or CPVC Transition Solvent Cement | D3138 |

**CANADA PIPE & FITTING & SOLVENT CEMENT MARKING**

| PVC & CPVC Pipe and Fittings | ULCS636 |
| PVC & CPVC Solvent Cement |  |
| ABS to PVC or CPVC Transition Cement |  |

**CAUTION**

Solvent cements for plastic pipe are flammable liquids and should be kept away from all sources of ignition. Do not use excessive amounts of solvent cement when making joints. Good ventilation should be maintained to reduce fire hazard and to minimize breathing of solvent vapors. Avoid contact of cement with skin and eyes.

**IMPORTANT**

SLP98UHV exhaust and intake connections are made of PVC. Use PVC primer and solvent cement when using PVC vent pipe. When using ABS vent pipe, use transitional solvent cement to make connections to the PVC fittings in the unit.

Use PVC primer and solvent cement or ABS solvent cement meeting ASTM specifications, refer to Table 2. As an alternate, use all purpose cement, to bond ABS, PVC, or CPVC pipe when using fittings and pipe made of the same materials. Use transition solvent cement when bonding ABS to either PVC or CPVC.

Low temperature solvent cement is recommended. Metal or plastic strapping may be used for vent pipe hangers. Uniformly apply a liberal coat of PVC primer for PVC...

</table>

*Requires field-provided and installed 1-1/2" exhaust accelerator.
† Termination kits 44W92, 44W93, 30G28 and 81J20 are approved for use in Canadian installations.
†† The 44W92 concentric kit includes a 1-1/2" accelerator which must be installed on the exhaust outlet when this kit is used with the SLP98UH-110-00B furnaces.

Canadian Applications Only - Pipe, fittings, primer and solvent cement used to vent (exhaust) this appliance must be certified to ULC S636 and supplied by a single manufacturer as part of an approved vent (exhaust) system. In addition, the first three feet of vent pipe from the furnace flue collar must be accessible for inspection.

Table 3 lists the available exhaust termination kits.

Joint Cementing Procedure

All cementing of joints should be done according to the specifications outlined in ASTM D 2855.

NOTE - A sheet metal screw may be used to secure the intake pipe to the connector, if desired. Use a drill or self tapping screw to make a pilot hole.

**DANGER**

DANGER OF EXPLOSION!

Fumes from PVC glue may ignite during system check. Allow fumes to dissipate for at least 5 minutes before placing unit into operation.

1 - Measure and cut vent pipe to desired length.
2 - Debur and chamfer end of pipe, removing any ridges or rough edges. If end is not chamfered, edge of pipe may remove cement from fitting socket and result in a leaking joint.
3 - Clean and dry surfaces to be joined.
4 - Test fit joint and mark depth of fitting on outside of pipe.
5 - Uniformly apply a liberal coat of PVC primer for PVC or use a clean dry cloth for ABS to clean inside socket surface of fitting and male end of pipe to depth of fitting socket.
6 - Promptly apply solvent cement to end of pipe and inside socket surface of fitting. Cement should be applied lightly but uniformly to inside of socket. Take care to keep excess cement out of socket. Apply second coat to end of pipe.
7 - Immediately after applying last coat of cement to pipe, and while both inside socket surface and end of pipe are wet with cement, forcefully insert end of pipe into socket until it bottoms out. Turn PVC pipe 1/4 turn during assembly (but not after pipe is fully inserted) to distribute cement evenly. DO NOT turn ABS or cellular core pipe.
8 - After assembly, wipe excess cement from pipe at end of fitting socket. A properly made joint will show a bead around its entire perimeter. Any gaps may indicate a defective assembly due to insufficient solvent.

**NOTE** - Check the inside of vent pipe thoroughly for any obstruction that may alter furnace operation.

**NOTE** - Time is critical at this stage. Do not allow primer to dry before applying cement.

**NOTE** - Assembly should be completed within 20 seconds after last application of cement. Hammer blows should not be used when inserting pipe.

9 - Handle joints carefully until completely set.
Venting Practices

Piping Suspension Guidelines

**SCHEDULE 40 PVC**
- Support every 5 feet.
- All other pipe* --
  - Support every 3 feet.

* See table 2 for allowable pipe.

**NOTE**
- Isolate piping at the point where it exits the outside wall or roof in order to prevent transmission of vibration to the structure.

Wall Thickness Guidelines

- 24” maximum
- 3/4” minimum

![Wall Thickness Diagram](image)

**FIGURE 14**

Intake Piping (Figures 18 and 19)

The SLP98UHV furnace is designed for combustion air intake through an inlet in the unit’s top cap. Intake air piping is independent of exhaust piping.

![Intake Piping Diagram](image)

**FIGURE 15**

1. In areas where piping penetrates joists or interior walls, hole must be large enough to allow clearance on all sides of pipe through center of hole using a hanger.

2. When furnace is installed in a residence where unit is shut down for an extended period of time, such as a vacation home, make provisions for draining condensate collection trap and lines.

Exhaust Piping (Figures 18 and 19)

3. Route piping to outside of structure. Continue with installation following instructions given in piping termination section.

Vent Piping Guidelines

The SLP98UHV is installed only as a Direct Vent gas central furnace.

**NOTE**
- In Direct Vent installations, combustion air is taken from outdoors and flue gases are discharged outdoors.

Intake and exhaust pipe sizing -- Size pipe according to tables 4 and 5. Table 4 lists the minimum vent pipe lengths permitted. Table 5 lists the maximum pipe lengths permitted.

Regardless of the diameter of pipe used, the standard roof and wall terminations described in section Exhaust Piping Terminations should be used. Exhaust vent termination pipe is sized to optimize the velocity of the exhaust gas as it exits the termination. Refer to table 7.

In some applications which permit the use of several different sizes of vent pipe, a combination vent pipe may be used. Contact Lennox’ Application Department for assistance in sizing vent pipe in these applications.

Use the steps in figure 17 to correctly size vent pipe diameter.

**NOTE**
- It is acceptable to use any pipe size which fits within the guidelines allowed in table 5.
**NOTE** - All horizontal runs of exhaust pipe must slope back toward unit. A minimum of 1/4" (6mm) drop for each 12" (305mm) of horizontal run is mandatory for drainage.

**NOTE** - Exhaust pipe MUST be glued to furnace exhaust fittings.

**NOTE** - Exhaust piping should be checked carefully to make sure there are no sags or low spots.

**FIGURE 16**

**NOTE** - The exhaust collar on all models is sized to accommodate 2” Schedule 40 vent pipe. In horizontal applications, any transition to exhaust pipe larger than 2” must be made in vertical runs of the pipe. Therefore a 2” elbow must be added before the pipe is transitioned to any size larger than 2”. This elbow must be added to the elbow count used to determine acceptable vent lengths. Contact the Application Department for more information concerning sizing of vent systems which include multiple pipe sizes.

**IMPORTANT**

Do not use screens or perforated metal in exhaust or intake terminations. Doing so will cause freeze-ups and may block the terminations.

</tbody>
</table>

1 In accordance with the current ANSI Z223.1/NFPA 54 Natural Fuel Gas Code
2 In accordance with the current CSA B149.1, Natural Gas and Propane Installation Code
† A vent shall not terminate directly above a sidewalk or paved driveway that is located between two single family dwellings and serves both dwellings.
‡ Permitted only if veranda, porch, deck or balcony is fully open on a minimum of two sides beneath the floor. Lennox recommends avoiding this location if possible.

* For clearances not specified in ANSI Z223.1/NFPA 54 or CSA B149.1, clearance will be in accordance with local installation codes and the requirements of the gas supplier and these installation instructions.
Details of Intake and Exhaust Piping Terminations for Direct Vent Installations

**NOTE** - In Direct Vent installations, combustion air is taken from outdoors and flue gases are discharged to outdoors.

**NOTE** - Flue gas may be slightly acidic and may adversely affect some building materials. If any vent termination is used and the flue gases may impinge on the building material, a corrosion-resistant shield (minimum 24 inches square) should be used to protect the wall surface. If the optional tee is used, the protective shield is recommended. The shield should be constructed using wood, plastic, sheet metal or other suitable material. All seams, joints, cracks, etc. in the affected area should be sealed using an appropriate sealant. See figure 23.

Intake and exhaust pipes may be routed either horizontally through an outside wall or vertically through the roof. In attic or closet installations, vertical termination through the roof is preferred. Figures 21 through 33 show typical terminations.

1 - Exhaust and intake exits must be in same pressure zone. Do not exit one through the roof and one on the side. Also, do not exit the intake on one side and the exhaust on another side of the house or structure.

2 - Intake and exhaust pipes should be placed as close together as possible at termination end (refer to illustrations). Maximum separation is 3" (76mm) on roof terminations and 6" (152mm) on side wall terminations.

3 - On roof terminations, the intake piping should terminate straight down using two 90° elbows (See figure 21).

4 - Exhaust piping must terminate straight out or up as shown. A reducer may be required on the exhaust piping at the point where it exits the structure to improve the velocity of exhaust away from the intake piping. See table 7.

**NOTE** - Care must be taken to avoid recirculation of exhaust back into intake pipe.

<td>6&quot; (152MM)</td>
</tr>
</tbody>
</table>

**Figure 23**

See venting table 5 for maximum venting lengths with this arrangement.

* Use wall support every 24" (610 mm). Use two wall supports if extension is greater than 24" (610 mm) but less than 48" (1219 mm).

**NOTE** - One wall support must be 6" (152 mm) from top of each pipe (intake and exhaust).
The exhaust termination tee should be connected to the 2” or 3” PVC flue pipe as shown in the illustration. Do not use an accelerator in applications that include an exhaust termination tee. The accelerator is not required.

As required. Flue gas may be acidic and may adversely affect some building materials. If a side wall vent termination is used and flue gases will impinge on the building materials, a corrosion-resistant shield (24 inches square) should be used to protect the wall surface. If optional tee is used, the protective shield is recommended. The shield should be constructed using wood, sheet metal or other suitable material. All seams, joints, cracks, etc. in affected area, should be sealed using an appropriate sealant.

Exhaust pipe 45° elbow can be rotated to the side away from the combustion air inlet to direct exhaust away from adjacent property. The exhaust must never be directed toward the combustion air inlet.

NOTE - See unit installation instructions for proper exhaust pipe termination size reduction.

1 The exhaust termination tee should be connected to the 2” or 3” PVC flue pipe as shown in the illustration. Do not use an accelerator in applications that include an exhaust termination tee. The accelerator is not required.

2 As required. Flue gas may be acidic and may adversely affect some building materials. If a side wall vent termination is used and flue gases will impinge on the building materials, a corrosion-resistant shield (24 inches square) should be used to protect the wall surface. If optional tee is used, the protective shield is recommended. The shield should be constructed using wood, sheet metal or other suitable material. All seams, joints, cracks, etc. in affected area, should be sealed using an appropriate sealant.

3 Exhaust pipe 45° elbow can be rotated to the side away from the combustion air inlet to direct exhaust away from adjacent property. The exhaust must never be directed toward the combustion air inlet.

*SLP98UH-070 and -090 units with the flush-mount termination must use the 1-1/2" accelerator supplied with the kit.

5 - On field-supplied terminations for side wall exit, exhaust piping may extend a maximum of 12 inches (305mm) for 2" PVC and 20 inches (508mm) for 3" (76mm) PVC beyond the outside wall. Intake piping should be as short as possible. See figures 22 and 24.

6 - On field-supplied terminations, a minimum distance between the end of the exhaust pipe and the end of the intake pipe without a termination elbow is 8" and a minimum distance of 6" with a termination elbow. See figures 22 and 24.

7 - If intake and exhaust piping must be run up a side wall to position above snow accumulation or other obstructions, piping must be supported every 24" (610mm) as shown in figures 22 and 24. In addition, close coupled wall termination kits must be extended for use in this application. See figures 31 and 32. When exhaust and intake piping must be run up an outside wall, the exhaust piping must be terminated with pipe sized per table 7. The intake piping may be equipped with a 90° elbow turndown. Using turndown will add 5 feet (1.5m) to the equivalent length of the pipe.

8 - Based on the recommendation of the manufacturer, a multiple furnace installation may use a group of up to four terminations assembled together horizontally, as shown in figure 28.

*Use wall support every 24" (610). Use two supports if extension is greater than 24" but less than 48".
SLP98 DIRECT VENT APPLICATION USING EXISTING CHIMNEY

NOTE - Do not discharge exhaust gases directly into any chimney or vent stack. If vertical discharge through an existing unused chimney or stack is required, insert piping inside chimney until the pipe open end is above top of chimney and terminate as illustrated. In any exterior portion of chimney, the exhaust vent must be insulated.

**FIGURE 33**

8" − 12" (203mm − 305mm)

3" − 8" (76mm − 203mm)

*SIZE TERMINATION PIPE PER TABLE 7.*

NOTE - Do not discharge exhaust gases directly into any chimney or vent stack. If vertical discharge through an existing unused chimney or stack is required, insert piping inside chimney until the pipe open end is above top of chimney and terminate as illustrated. In any exterior portion of chimney, the exhaust vent must be insulated.

**Condensate Piping**

This unit is designed for either right- or left-side exit of condensate piping in upflow applications. In horizontal applications, the condensate trap must extend below the unit. An 8" service clearance is required for the condensate trap. Refer to figure 34 for condensate trap locations. **NOTE** - If necessary the condensate trap may be installed up to 5 feet away from the furnace. Piping from furnace must slope down a minimum of 1/4" per ft. toward trap.

**CONDESATE TRAP LOCATIONS**
(Unit shown in upflow position with remote trap)

**FIGURE 35**

Condensate line must be sloped downward away from condensate trap to drain. If drain level is above condensate trap, condensate pump must be used. Condensate drain line should be routed within the conditioned space to avoid freezing of condensate and blockage of drain line. If this is not possible, a heat cable kit may be used on the condensate trap and line. Heating cable kit is available from Lennox in various lengths; 6 ft. (1.8m) - kit no. 26K68; 24 ft. (7.3m) - kit no. 26K69; and 50 ft. (15.2m) - kit no. 26K70.

**CAUTION**

Do not use copper tubing or existing copper condensate lines for drain line.

1 - Determine which side condensate piping will exit the unit, location of trap, field-provided fittings and length of PVC pipe required to reach available drain.

2 - Remove plug (figure 34) from the cold end header box at the appropriate location on the side of the unit. Install field-provided 1/2 NPT male fitting into cold end header box. Use teflon tape or appropriate pipe dope.

3 - Install drain trap using appropriate PVC fittings, glue all joints. Glue the provided drain trap as shown in figure 36. Route the condensate line to an open drain. **NOTE** - Vinyl tubing may be used for condensate drain. Tubing must be 1-1/4" OD X 1" ID and should be attached to the drain on the trap using a hose clamp.

4 - If unit will be started immediately upon completion of installation, prime trap per procedure outlined in Unit Start-Up section.

*Piping from furnace must slope down a minimum of 1/4” per ft. toward trap.
Gas Piping

⚠️ CAUTION ⚠️
If a flexible gas connector is required or allowed by the authority that has jurisdiction, black iron pipe shall be installed at the gas valve and extend outside the furnace cabinet. The flexible connector can then be added between the black iron pipe and the gas supply line.

⚠️ WARNING ⚠️
Do not exceed 600 in-lbs (50 ft-lbs) torque when attaching the gas piping to the gas valve.

1 - Gas piping may be routed into the unit through either the left- or right-hand side in upflow applications, and either the top or bottom in horizontal applications. Supply piping enters into the gas valve from the side of the valve as shown in figures 40 and 41.

2 - When connecting gas supply, factors such as length of run, number of fittings and furnace rating must be considered to avoid excessive pressure drop. Table 8 lists recommended pipe sizes for typical applications.

**NOTE** - Use two wrenches when connecting gas piping to avoid transferring torque to the manifold.

3 - Gas piping must not run in or through air ducts, clothes chutes, chimneys or gas vents, dumb waiters or elevator shafts. Center gas line through piping hole. Gas line should not touch side of unit. See figures 40 and 41.

4 - Piping should be sloped 1/4 inch per 15 feet (6mm per 5.6m) upward toward the gas meter from the furnace. The piping must be supported at proper intervals, every 8 to 10 feet (2.44 to 3.05m), using suitable hangers or straps. Install a drip leg in vertical pipe runs to serve as a trap for sediment or condensate.

5 - A 1/8" N.P.T. plugged tap or pressure post is located on the gas valve to facilitate test gauge connection. See figures 49.

6 - In some localities, codes may require installation of a manual main shut-off valve and union (furnished by installer) external to the unit. Union must be of the ground joint type.

⚠️ IMPORTANT ⚠️
Compounds used on threaded joints of gas piping must be resistant to the actions of liquified petroleum gases.

![FIGURE 39]

**MANUAL MAIN SHUT-OFF VALVE WILL NOT HOLD NORMAL TEST PRESSURE**

**1/8" N.P.T. PLUGGED TAP**

**CAP**

**FURNACE**

**ISOLATE GAS VALVE**

**Leak Check**
After gas piping is completed, carefully check all piping connections (factory- and field-installed) for gas leaks. Use a leak detecting solution or other preferred means. The furnace must be isolated from the gas supply system by closing its individual manual shut-off valve during any pressure testing of the gas supply system at pressures less than or equal to 1/2 psig (3.48 kPa, 14 inches w.c.).

⚠️ IMPORTANT ⚠️
When testing gas lines using pressures in excess of 1/2 psig (3.48 kPa), gas valve must be disconnected and isolated. See figure 39. Gas valves can be damaged if subjected to pressures greater than 1/2 psig (3.48 kPa).

⚠️ WARNING ⚠️
FIRE OR EXPLOSION HAZARD
Failure to follow the safety warnings exactly could result in serious injury, death, or property damage. Never use an open flame to test for gas leaks. Check all connections using a commercially available soap solution made specifically for leak detection. Some soaps used for leak detection are corrosive to certain metals. Carefully rinse piping thoroughly after leak test has been completed.

NOTE - BLACK IRON PIPE ONLY TO BE ROUTED INSIDE OF CABINET
Removal of the Furnace from Common Vent

In the event that an existing furnace is removed from a venting system commonly run with separate gas appliances, the venting system is likely to be too large to properly vent the remaining attached appliances.

Conduct the following test while each appliance is operating and the other appliances (which are not operating) remain connected to the common venting system. If the venting system is venting properly, (step 3) return all doors, widows, exhaust fans, fireplace dampers, and any other gas-burning appliances to their previous mode of operation.

1 - Seal any unused openings in the common venting system.

2 - Inspect the venting system for proper size and horizontal pitch. Determine that there is no blockage, restriction, leakage, corrosion, or other deficiencies which could cause an unsafe condition.

3 - Close all building doors and windows and all doors between the space in which the appliances remaining connected to the common venting system are located and other spaces of the building. Turn on clothes dryers and any appliances not connected to the common venting system. Turn on any exhaust fans, such as range hoods and bathroom exhausts, so they will operate at maximum speed. Do not operate a summer exhaust fan. Close fireplace dampers.

4 - Follow the lighting instructions. Turn on the appliance that is being inspected. Adjust the thermostat so that the appliance operates continuously.

5 - After the main burner has operated for 5 minutes, test for leaks of flue gases at the draft hood relief opening. Use the flame of a match or candle.

6 - After determining that each appliance connected to the common venting system is venting properly, (step 3) return all doors, widows, exhaust fans, fireplace dampers, and any other gas-burning appliances to their previous mode of operation.

7 - If a venting problem is found during any of the preceding tests, the common venting system must be modified to correct the problem.

Resize the common venting system to the minimum vent pipe size determined by using the appropriate tables in Appendix G. (These are in the current standards of the National Fuel Gas Code ANSI Z223.1.

Electrical

ELECTROSTATIC DISCHARGE (ESD)
Precautions and Procedures

CAUTION

Electrostatic discharge can affect electronic components. Take precautions during furnace installation and service to protect the furnace’s electronic controls. Precautions will help to avoid control exposure to electrostatic discharge by putting the furnace, the control and the technician at the same electrostatic potential. Neutralize electrostatic charge by touching hand and all tools on an unpainted unit surface, such as the gas valve or blower deck, before performing any service procedure.

INTERIOR MAKE-UP BOX INSTALLATION

The unit is equipped with a field make-up box on the left hand side of the cabinet. The make-up box may be moved to the right side of the furnace to facilitate installation. If the make-up box is moved to the right side, clip the wire ties that bundle the wires together. The excess wire must be pulled into the blower compartment. Secure the excess wire to the existing harness to protect it from damage.

Refer to figure 44 for unit field wiring. See figures 45 and 46 for icomfort Touch™ thermostat wiring in communicating applications. Table 12 shows DIP switch and on-board link settings for non-communicating thermostat applications. Typical wiring schematic is shown in figure 47.

1 - The power supply wiring must meet Class I restrictions. Protected by either a fuse or circuit breaker, select circuit protection and wire size according to unit nameplate.

NOTE - Unit nameplate states maximum current draw. See table for maximum over-current protection.

<table>
<thead>
<tr>
<th>SLP98UHV Model</th>

</tr>
<tr>
<td>090-60C, 110-60C, 135-60D</td>
<td>20</td>
</tr>
</tbody>
</table>

2 - Holes are on both sides of the furnace cabinet to facilitate wiring.

3 - Install a separate (properly sized) disconnect switch near the furnace so that power can be turned off for servicing.

4 - Before connecting the thermostat or the power wiring, check to make sure the wires will be long enough for servicing at a later date. Remove the blower access panel to check the length of the wire.

5 - Complete the wiring connections to the equipment. Use the provided unit wiring diagram and the field wiring diagram shown in figure 44 and table 12. Use 18-gauge wire or larger that is suitable for Class II rating for thermostat connections.

NOTE - Do NOT make a wire connection between the room thermostat L terminal and the L terminal of the SLP98UHV integrated control unless this is a communicating thermostat installation with a non-communicating outdoor unit.

6 - Electrically ground the unit according to local codes or, in the absence of local codes, according to the current National Electric Code (ANSI/NFPA No. 70) for the USA and current Canadian Electric Code part 1 (CSA standard C22.1) for Canada. A green ground wire is provided in the field make-up box.

7 - One line voltage “EAC” 1/4” spade terminal is provided on the furnace integrated control. Any electronic air cleaner or other 120V accessory rated up to one amp can be connected to this terminal with the neutral leg.
of the circuit being connected to one of the provided neutral terminals. See figure 48 for location of terminal. This terminal is energized when the indoor blower is operating.

8 - One line voltage "HUM" 1/4" spade terminal is provided on the furnace integrated control. Any humidifier or other 120V accessory rated up to one amp can be connected to this terminal with the neutral leg of the circuit being connected to one of the provided neutral terminals. See figure 48 for location of terminal. This terminal is energized in the heating mode when the indoor blower is operating.

9 - One 24V "H" terminal is provided on the furnace integrated control terminal block. Any humidifier rated up to 0.5 amp can be connected to this terminal with the ground leg of the circuit being connected to either ground or the "C" terminal. See figure 48 for location of terminal.

10 - Install the room thermostat according to the instructions provided with the thermostat. See table 12 for thermostat connections. If the furnace is being matched with a heat pump, refer to the instruction packaged with the dual fuel thermostat.

NOTE - The discharge air temperature sensor is intended to be mounted downstream of the heat exchanger and air conditioning coil. It must be placed in free airflow, where other accessories (humidifiers, UV lights etc.) will not interfere with its accuracy. Wiring distance between the furnace and discharge air sensor should not exceed 10 ft. when wired with 18-gauge thermostat wire.

**Thermostat Selection**

The SLP98UHV is designed to operate in a variable rate capacity mode using a two-stage thermostat. The SLP98UHV will automatically adjust firing rate based upon thermostat cycle times.

The icomfort Touch thermostat must be used in communicating applications. Refer to the instructions provided with the thermostat for installation, set-up and operation.

For optimal performance in non-communicating applications, Lennox recommends use of a ComfortSense® 7000 high quality electronic digital thermostat or any other with adjustable settings for 1st stage / 2nd stage on / off differentials and adjustable stage timers.

Lennox recommends the following two-stage thermostat set-up for optimal variable rate capacity mode:

First heat stage differential set to 1/2 to 1 degree F; second heat stage differential set to 1/2 or 1 degree F; second heat stage upstage timer disabled, or set to maximum (1 hr minimum).

**Indoor Blower Speeds**

NOTE - When the SLP98UHV is used with icomfort Touch thermostat, proper indoor blower speed selections are made by the communicating thermostat.

1 - When the thermostat is set to "FAN ON," the indoor blower will run continuously at a percentage of the second-stage cooling speed when there is no cooling or heating demand. The percentage is set using DIP switches 6 and 7.

2 - When the SLP98UHV is running in the heating mode, the integrated control will automatically adjust the blower speed to match the furnace firing rate. This speed can be adjusted up or down by 7.5% or 15% using DIP switches 14 through 16 for the low heat speed and 17 through 19 for the high heat speed.

3 - When there is a cooling demand, the indoor blower will run on the cooling speed designated by the positions of DIP switches 8 through 11.

**Generator Use - Voltage Requirements**

The following requirements must be kept in mind when specifying a generator for use with this equipment:

- The furnace requires 120 volts ± 10% (Range: 108 volts to 132 volts).
- The furnace operates at 60 Hz ± 5% (Range: 57 Hz to 63 Hz).
- The furnace integrated control requires both polarity and proper ground. Both polarity and proper grounding should be checked before attempting to operate the furnace on either permanent or temporary power.
- Generator should have a wave form distortion of less than 5% THD (total harmonic distortion).

NOTE - When the SLP98UHV is used with an icomfort Touch™ communicating thermostat, all indoor blower speed selections and DIP switch settings are made by the communicating thermostat.

SLP98UHV units are equipped with an integrated control. This control manages ignition timing, combustion air inductor speed, heating mode fan off delays and indoor blower speeds based on selections made using the icomfort Touch™ thermostat or the control DIP switches and onboard links. The control includes an internal Watchguard feature which automatically resets the ignition control when it has been locked out.

NOTE - All DIP switches are factory shipped in the “OFF” position.

Heating Operation DIP Switch Settings -- Figure 48

Switch 1 -- Thermostat Selection -- This unit may be used with either a single-stage or two-stage thermostat. The thermostat selection is made using a DIP switch which must be properly positioned for the particular application. The DIP switch is factory-positioned for use with a two-stage thermostat. If a single-stage thermostat is to be used, the DIP switch must be repositioned. See table 13.

Switch 2 -- Operating Mode with Two-Stage Thermostat -- If a two-stage thermostat is used, the furnace can operate in either variable-capacity or conventional two-stage mode. When variable-capacity mode is selected, the firing rate of the unit is varied to maximize comfort. Conventional two-stage mode is the factory default setting. See table 13.

Switch 3 -- Second-Stage Heat On Delay -- If a single-stage thermostat is used, the integrated control can be used to energize second-stage heat after either 7 minutes or 12 minutes of first-stage heat operation. See table 13.

Switches 4 and 5 -- Blower-Off Delay -- The blower-on delay of 30 seconds is not adjustable. The blower-off delay (time that the blower operates after the heating demand has been satisfied) can be adjusted by moving switches 4 and 5 on the integrated control. The unit is shipped from the factory with a blower-off delay of 90 seconds. The blower-off delay affects comfort and is adjustable to satisfy individual applications. Adjust the blower off delay to achieve a supply air temperature between 90° and 110°F at the exact moment that the blower is de-energized. Longer off delay settings provide lower supply air temperatures; shorter settings provide higher supply air temperatures. Table 14 provides the blower-off timings that will result from different switch settings.

### TABLE 14
Blower-Off Delay Switch Settings

</tbody>
</table>

Indoor Blower Operation DIP Switch Settings

Switches 6 and 7 -- Continuous Indoor Fan Operation-Blower Speed -- The unit is shipped from the factory with the DIP switches positioned for medium low (2) speed during continuous indoor blower operation. The table below provides the continuous blower speeds that will result from different switch settings. Refer to tables beginning on page 42 for corresponding cfm values.

### TABLE 15
Continuous Indoor Blower Operation -- Blower Speeds

<table>
<thead>
<tr>
<th>Speed</th>

</tr>
</tbody>
</table>

* Percentage of high speed cooling
Switches 8 and 9 -- Cooling Mode Blower Speed -- The unit is shipped from the factory with the DIP switches positioned for high speed (4) indoor blower motor operation during the cooling mode. The table below provides the cooling mode blower speeds that will result from different switch settings. Refer to tables beginning on page 42 for corresponding cfm values.

| TABLE 16
<table>
<thead>
<tr>
<th>Cooling Mode Blower Speeds</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Speed</strong></td>
</tr>
<tr>
<td>1 - Low</td>
</tr>
<tr>
<td>2 - Medium Low</td>
</tr>
<tr>
<td>3 - Medium High</td>
</tr>
<tr>
<td>4 - High (Factory)</td>
</tr>
</tbody>
</table>

Switches 10 and 11 -- Cooling Mode Blower Speed Adjustment -- The unit is shipped from the factory with the DIP switches positioned for NORMAL (no) adjustment. The DIP switches may be positioned to adjust the blower speed by +10% or -10% to better suit the application. Table 17 provides blower speed adjustments that will result from different switch settings. Refer to tables beginning on page 42 for corresponding cfm values.

With switches 10 and 11 set to ON, motor will bypass ramping profiles and all delays and will immediately run at selected COOLING speed upon a call for cool. LED will continue to operate as normal. This mode is used to check motor operation.

| TABLE 17
<table>
<thead>
<tr>
<th>Cooling Mode Blower Speed Adjustment</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Adjustment</strong></td>
</tr>
<tr>
<td>+10% (approx.)</td>
</tr>
<tr>
<td>NORMAL (Factory)</td>
</tr>
<tr>
<td>-10% (approx.)</td>
</tr>
<tr>
<td>MOTOR TEST</td>
</tr>
</tbody>
</table>

Switches 12 and 13 -- Cooling Mode Blower Speed Ramping -- Blower speed ramping may be used to enhance dehumidification performance. The switches are factory set at option A which has the greatest effect on blower motor performance. Table 18 provides the cooling mode blower speed ramping options that will result from different switch settings. The cooling mode blower speed ramping options are detailed below.

**NOTE** - The off portion of the selected ramp profile only applies during heat pump operation in dual fuel applications.

| TABLE 18
<table>
<thead>
<tr>
<th>Cooling Mode Blower Speed Ramping</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Ramping Option</strong></td>
</tr>
<tr>
<td>A (Factory)</td>
</tr>
<tr>
<td>B</td>
</tr>
<tr>
<td>C</td>
</tr>
<tr>
<td>D</td>
</tr>
</tbody>
</table>

**Ramping Option A (Factory Selection)**
- Motor runs at 50% for 30 seconds.
- Motor then runs at 82% for approximately 7-1/2 minutes.
- If demand has not been satisfied after 7-1/2 minutes, motor runs at 100% until demand is satisfied.
- Once demand is met, motor runs at 50% for 30 seconds then ramps down to stop.

**Ramping Option B**
- Motor runs at 82% for approximately 7-1/2 minutes. If demand has not been satisfied after 7-1/2 minutes, motor runs at 100% until demand is satisfied.
- Once demand is met, motor ramps down to stop.

**Ramping Option C**
- Motor runs at 100% until demand is satisfied.
- Once demand is met, motor runs at 100% for 45 seconds then ramps down to stop.

**Ramping Option D**
- Motor runs at 100% until demand is satisfied.
- Once demand is met, motor ramps down to stop.
Switches 14 through 19 -- Heating Mode Blower Speed
-- These switches are factory set at the OFF position which provides 100% of normal speed during HIGH HEAT demand, 70% of normal speed during MID-RANGE HEAT demand and 35% of normal speed during LOW HEAT demand. Switches 14, 15 and 16 are used to adjust the LOW HEAT blower motor speed. Switches 17, 18 and 19 are used to adjust the HIGH HEAT blower motor speed. Table 19 provides the heating mode blower speeds that will result from different switch settings. Refer to tables beginning on page 42 for corresponding cfm values.

On-Board Links

On-Board links must be clipped (when applicable) before unit is placed into operation with a non-communicating thermostat.

**On-Board Link W914 DS to R (Figure 48)**

On-board link W914, is a clippable connection between terminals DS and R on the integrated control. W914 must be cut when the furnace is installed with either the Harmony III™ zone control or a thermostat which features humidity control. If the link is left intact the PMW signal from the Harmony III control will be blocked and also lead to control damage. Refer to table 21 for operation sequence in applications including SLP98UHV, a thermostat which features humidity control and a single-speed outdoor unit. Table 22 gives the operation sequence in applications with a two-speed outdoor unit.

**On-Board Link W951 R to O (Figure 48)**

On-board link W951 is a clippable connection between terminals R and O on the integrated control. W951 must be cut when the furnace is installed in applications which include a heat pump unit and a thermostat which features dual fuel use. If the link is left intact, terminal “O” will remain energized eliminating the HEAT MODE in the heat pump.

On-Board Link W915 Y1 to Y2 (Figure 48)

On-board link W915 is a clippable connection between terminals Y1 and Y2 on the integrated control. W915 must be cut if two-stage cooling will be used. If the link is not cut the outdoor unit will operate in second-stage cooling only.

**Diagnostic LED (Figure 48)**

The seven-segment diagnostic LED displays operating status, target airflow, error codes and other information. The table beginning on Page 62 lists diagnostic LED codes.

**Diagnostic Push Button (Figure 48)**

The diagnostic push button is located adjacent to the seven-segment diagnostic LED. This button is used to enable the Error Code Recall mode and the Field Test mode. Press the button and hold it to cycle through a menu of options. Every five seconds a new menu item will be displayed. When the button is released, the displayed item will be selected. Once all items in the menu have been displayed, the menu resumes from the beginning until the button is released.

**Error Code Recall Mode**

Select “E” from the menu to access the most recent 10 error codes. Select “c” from the Error Code Recall menu to clear all error codes. Button must be pressed a second time while “c” is flashing to confirm command to delete codes. Press the button until a solid “≡” is displayed to exit the Error Code Recall mode.

**Field Test Mode**

Use the diagnostic push button to scroll through the menu as described above. Release the button when the LED flashes “-” to select the Field Test mode.

While in the Field Test mode the technician can:

- Initiate furnace ignition and move to and hold low-fire rate by applying a R to W1 jumper.
- Initiate furnace ignition sequence and move to and hold high-fire rate by applying a jumper from R to W1 and W2.
- Initiate furnace ignition sequence and move to and hold mid-fire rate by applying a jumper to R and W2.
- Apply then remove the jumper from R to W1 and W2 to change the firing rate from low fire to mid fire and high fire.
- A vent calibration sequence can be initiated even if a thermostat signal is not present. Press and hold the push button until a solid “C” is displayed. Release the button and calibration will begin. The furnace will perform the high-fire and low-fire pressure switch calibrations and display “CAL”. After calibration, the LED will return to the flashing “-” display.

During Field Test mode operation, all safety switches are still in the circuit (they are not by-passed) and indoor blower performance and timings will match DIP switch selections. Current furnace firing rate, indoor blower CFM and flame signal will be displayed. To exit the Field Test mode, press and hold the button. The menu will resume from the beginning. Also, cycle the main power to exit the Field Test mode. The integrated control will automatically exit the Field Test mode after 45 minutes of operation.

The effect of static pressure is included in air volumes shown.
The following control configurations are available. See Installation Instructions for details and DIP switch settings.

**Heat Modes Available (Heating Blower Performance Table):**
- Single stage thermostat:
  - 35%, 70%, 100% input (three-stage) with time delays in-between
- Two-stage thermostat:
  - Variable Rate Capacity Mode - furnace automatically adjusts firing rate based on first- and second-stage cycle times
  - W1 demand at 70% input, W2 demand at 100% input. No delay between stages
- icomfort Touch™ Communicating Thermostat:
  - Variable Rate Capacity Mode - furnace automatically adjusts firing rate based on first- and second-stage cycle times
  - 35%, 60%, 80%, 100% (four-stage) with time delays in-between

**Cool Mode Available (Cooling Blower Performance table):**
- First stage COOL (two-stage air conditioning units only) is approximately 70% of the same second stage COOL speed position.
- Continuous Fan speeds are approximately 28%, 38%, 70% and 100% (DIP switch selectable) of the same second-stage COOL speed position minimum 300 cfm.

Lennox Harmony III™ Zoning System Applications - Minimum blower speed is 250 cfm.

The effect of static pressure is included in air volumes shown.

The following control configurations are available. See Installation Instructions for details and DIP switch settings.

**Heat Modes Available (Heating Blower Performance Table):**
- Single stage thermostat:
  - 35%, 70%, 100% input (three-stage) with time delays in-between
- Two-stage thermostat:
  - Variable Rate Capacity Mode - furnace automatically adjusts firing rate based on first- and second-stage cycle times
  - W1 demand at 70% input, W2 demand at 100% input. No delay between stages
- iComfort Touch™ Communicating Thermostat:
  - Variable Rate Capacity Mode - furnace automatically adjusts firing rate based on first- and second-stage cycle times
  - 35%, 60%, 80%, 100% (four-stage) with time delays in-between

**Cool Mode Available (Cooling Blower Performance table):**
- First stage COOL (two-stage air conditioning units only) is approximately 70% of the same second stage COOL speed position.
- Continuous Fan speeds are approximately 28%, 38%, 70% and 100% (DIP switch selectable) of the same second-stage COOL speed position with minimum 300 cfm.

Lennox Harmony III™ Zoning System Applications - Minimum blower speed is 250 cfm.

On-board links at indoor unit with a two-stage outdoor unit:
Cut factory link from Y1 to Y2 or cut W915 (Y1 to Y2) on SureLight® integrated control.
With Condensing unit - Cut W914 (R to DS) on SureLight® integrated control;
With Heat Pump - Cut W914 (R to DS) & W951 (R to O) on SureLight® integrated control.
*ComfortSense® 7000 thermostat only
Unit Start-Up
FOR YOUR SAFETY READ BEFORE OPERATING

WARNING
Do not use this furnace if any part has been underwater. A flood-damaged furnace is extremely dangerous. Attempts to use the furnace can result in fire or explosion. Immediately call a qualified service technician to inspect the furnace and to replace all gas controls, control system parts, and electrical parts that have been wet or to replace the furnace, if deemed necessary.

WARNING
Do not use this furnace if any part has been underwater. A flood-damaged furnace is extremely dangerous. Attempts to use the furnace can result in fire or explosion. Immediately call a qualified service technician to inspect the furnace and to replace all gas controls, control system parts, and electrical parts that have been wet or to replace the furnace, if deemed necessary.

WARNING
Danger of explosion. Can cause injury or product or property damage. Should the gas supply fail to shut off or if overheating occurs, shut off the gas valve to the furnace before shutting off the electrical supply.

CAUTION
Before attempting to perform any service or maintenance, turn the electrical power to unit OFF at disconnect switch.

WARNING
During blower operation, the ECM motor emits energy that may interfere with pacemaker operation. Interference is reduced by both the sheet metal cabinet and distance.

Priming Condensate Trap
The condensate trap should be primed with water prior to start-up to ensure proper condensate drainage. Either pour 10 fl. oz. (300 ml) of water into the trap, or follow these steps to prime the trap:

1 - Follow the lighting instructions to place the unit into operation.
2 - Set the thermostat to initiate a heating demand.
3 - Allow the burners to fire for approximately 3 minutes.
4 - Adjust the thermostat to deactivate the heating demand.
5 - Wait for the combustion air inducer to stop. Set the thermostat to initiate a heating demand and again allow the burners to fire for approximately 3 minutes.
6 - Adjust the thermostat to deactivate the heating demand and again wait for the combustion air inducer to stop. At this point, the trap should be primed with sufficient water to ensure proper condensate drain operation.

BEFORE PLACING THE UNIT INTO OPERATION, smell all around the furnace area for gas. Be sure to smell next to the floor because some gas is heavier than air and will settle on the floor.

The gas valve on the SLP98UHV is equipped with a gas control switch. Use only your hand to move the control switch. Never use tools. If the switch will not move by hand, do not try to repair it. Force or attempted repair may result in a fire or explosion.

Placing the furnace into operation:
SLP98UHV units are equipped with an automatic ignition system. Do not attempt to manually light burners on this furnace. Each time the thermostat calls for heat, the burners will automatically light. The ignitor does not get hot when there is no call for heat on units with this ignition system.

WARNING
If you do not follow these instructions exactly, a fire or explosion may result causing property damage, personal injury or death.

Gas Valve Operation (Figure 49)

1 - STOP! Read the safety information at the beginning of this section.
2 - Set the thermostat to the lowest setting.
3 - Turn off all electrical power to the unit.
4 - This furnace is equipped with an ignition device which automatically lights the burners. Do not try to light the burners by hand.
5 - Remove the access panel.
6 - Move the gas valve switch to the OFF position. See figure 49.
7 - Wait five minutes to clear out any gas. If you then smell gas, STOP! Immediately call the gas supplier from a neighbor’s phone. Follow the gas supplier’s instructions. If you do not smell gas go to next step.
8 - Move gas valve switch to the ON position. See figure 49. Do not force.

![Gas Valve Diagram](image-url)
9 - Replace the access panel.
10- Turn on all electrical power to to the unit.
11- Set the thermostat to desired setting.

**NOTE** - When unit is initially started, steps 1 through 11 may need to be repeated to purge air from gas line.

12- If the appliance will not operate, follow the instructions “Turning Off Gas to Unit” and call the gas supplier.

### Turning Off Gas to Unit

1 - Set the thermostat to the lowest setting.
2 - Turn off all electrical power to the unit if service is to be performed.
3 - Remove the access panel.
4 - Move the gas valve switch to the **OFF** position.
5 - Replace the access panel.

### Failure To Operate

If the unit fails to operate, check the following:

1 - Is the thermostat calling for heat?
2 - Are access panels securely in place?
3 - Is the main disconnect switch closed?
4 - Is there a blown fuse?
5 - Is the filter dirty or plugged? Dirty or plugged filters will cause the limit control to shut the unit off.
6 - Is gas turned on at the meter?
7 - Is the manual main shut-off valve open?
8 - Is the gas valve turned on?
9 - Is the unit ignition system in lock out? If the unit locks out again, inspect the unit for blockages.
10 - Is blower harness connected to ignition control? Furnace will not operate unless harness is connected.

### Gas Pressure Measurement

#### Gas Flow (Approximate)

**TABLE 23**

- Natural-1000 btu/cu ft
- LP-2500 btu/cu ft

Furnace should operate at least 5 minutes before checking gas flow. Determine time in seconds for **two** revolutions of gas through the meter. (Two revolutions assures a more accurate time.) **Divide by two** and compare to time in table 23 below. If manifold pressure matches table 27 and rate is incorrect, check gas orifices for proper size and restriction. Remove temporary gas meter if installed.

**NOTE** - To obtain accurate reading, shut off all other gas appliances connected to meter.

### Supply Pressure Measurement

A threaded plug on the inlet side of the gas valve provides access to the supply pressure tap. Remove the threaded plug, install a field-provided barbed fitting and connect a manometer to measure supply pressure. Replace the threaded plug after measurements have been taken.

### Manifold Pressure Measurement (Figure 50)

To correctly measure manifold pressure, the differential pressure between the positive gas manifold and the negative burner box must be considered. Use **pressure test adapter kit** (available as Lennox part 10L34) to assist in measurement.

1 - Remove the threaded plug from the outlet side of the gas valve and install a field-provided barbed fitting. Connect measuring device "+" connection to barbed fitting to measure manifold pressure.
2 - Tee into the gas valve regulator vent hose and connect measuring device "-" connection.
3 - Start unit on low heat (35% rate) and allow 5 minutes for unit to reach steady state.
4 - While waiting for the unit to stabilize, notice the flame. Flame should be stable and should not lift from burner. Natural gas should burn blue.
5 - After allowing unit to stabilize for 5 minutes, record manifold pressure and compare to value given in table 24.
6 - Repeat steps 3, 4 and 5 on high heat.

**NOTE** - Shut unit off and remove manometer as soon as an accurate reading has been obtained. Take care to remove barbed fitting and replace threaded plug.

### Operating Pressure Signal (Delta P) Measurement (Figure 51)

Operating pressure signal can be taken while the manifold pressure pressure check is taken (using two measuring devices). Or, taken after the manifold pressure measurement is complete.

1 - Tee into the negative line between the gas valve and pressure switch and connect to measuring device negative "-".
2 - Tee into the positive line between the gas valve and pressure switch and connect to measuring device positive "+".
3 - Start unit on low heat (35% rate) and allow 5 minutes for unit to reach steady state.
4 - After allowing unit to stabilize for 5 minutes, record operating pressure signal and compare to value given in table 24.
5 - Repeat steps 3 on 4 high heat.

**NOTE** - A natural to LP/propane gas changeover kit (table 27) is necessary to convert this unit. Refer to the changeover kit installation instruction for the conversion procedure.

**Proper Combustion**

Furnace should operate a minimum of 15 minutes with correct manifold pressure and gas flow rate before checking combustion. Take combustion sample beyond the flue outlet and compare to the tables below. The maximum carbon monoxide reading should not exceed 50 ppm.

**High Altitude Information**

**NOTE** - In Canada, certification for installations at elevations over 4500 feet (1372 m) is the jurisdiction of local authorities.

SLP98UHV units require no manifold pressure adjustments for operation at altitudes up to 10,000 feet (3048 m) above sea level. Units installed at altitude of 7,501 to 10,000 feet (2287 to 3048m) require a pressure switch change per table 27. Table 27 also lists conversion kit requirements.

The combustion air pressure switch is factory-set and requires no adjustment.

**Other Unit Adjustments**

**Primary Limit**
The primary limit is located on the heating compartment vestibule panel. This limit is factory set and require no adjustment.

**Flame Rollout Switches (Two)**
These manually reset switches are located on the inside of the burner box. If tripped, check for adequate combustion air before resetting.
Pressure Switches (Two)
The pressure switches are located on the cold end header box. These switches check for proper combustion air inducer operation before allowing ignition trial. The switches are factory-set and require no adjustment. Pressure switch tubing installation is critical for safe operation. See figure 52.

Thermostat Heat Anticipation
Set the heat anticipator setting (if adjustable) according to the amp draw listed on the wiring diagram that is attached to the unit.

Electronic Ignition
The integrated control has an added feature of an internal Watchguard control. The feature serves as an automatic reset device for ignition control lockout caused by ignition failure. This type of lockout is usually due to low gas line pressure. After one hour of continuous thermostat demand for heat, the Watchguard will break and remake thermostat demand to the furnace and automatically reset the control to begin the ignition sequence.

Exhaust and Air Intake Pipe
1 - Check exhaust and air intake connections for tightness and to make sure there is no blockage.
2 - Are pressure switches closed? Obstructed exhaust pipe will cause unit to shut off at pressure switches. Check termination for blockages.
3 - Reset manual flame rollout switches on burner box cover.

Heating Sequence of Operation
The integrated control initiates a pressure switch calibration at the initial unit start-up on a call for heat. The ignition control will also initiate a calibration any time main power is turned off and back on and a heating demand is present. Additional calibrations may be initiated by the service technician during field test sequence. The following heating sequence of operation assumes completion of a successful calibration.

NOTE - In icomfort Touch™ communicating applications, the sequence of operation is the same but all DIP switch settings are overridden by the thermostat.

NOTE - The thermostat selection DIP switch on the integrated control is factory-set in the "TWO-STAGE" position.

Applications Using a Two-Stage Thermostat

A - Heating Sequence -- Control Thermostat Selection DIP switch in “Two-Stage” Position (Factory Setting)
1 - On a call for heat, thermostat first-stage contacts close sending a signal to the integrated control. The integrated control runs a self-diagnostic program and checks high temperature limit switches for normally closed contacts and pressure switches for normally open contacts. The combustion air inducer is energized at ignition speed, which is approximately the same as the inducer speed at 70 percent firing rate.
2 - Once the control receives a signal that the low-fire pressure switch has closed, the combustion air inducer begins a 15-second pre-purge in the ignition speed.
3 - After the pre-purge is complete, a 20-second initial ignitor warm-up period begins. The combustion air inducer continues to operate at the ignition speed.

Temperature Rise
After the furnace has been started and supply and return air temperatures have been allowed to stabilize, check the temperature rise with the unit operating at 100 percent firing rate. If necessary, adjust the blower speed to maintain the temperature rise within the range shown on the unit nameplate. Increase the blower speed to decrease the temperature. Decrease the blower speed to increase the temperature rise. Failure to adjust the temperature rise may cause erratic limit operation.
4 - After the 20-second warm-up period has ended, the gas valve is energized and ignition occurs. At the same time, the control module sends a signal to begin an indoor blower 30-second ON-delay. When the delay ends, the indoor blower motor is energized at a speed that matches the firing rate. After the 10-second ignition stabilization delay expires, the inducer speed is adjusted to the appropriate target rate. The inducer will remain at the 70 percent speed as long as the thermostat has a first-stage heating demand.

5 - If second-stage heat is required, the thermostat second-stage heat contacts close and send a signal to the integrated control. The integrated control initiates a 30-second second-stage recognition delay.

6 - At the end of the recognition delay and on all subsequent calls for heat in the same heating cycle, the integrated control energizes the combustion air inducer at high speed. The control also checks the high-fire pressure switch to make sure it is closed. As the inducer speed is increased to high, the indoor blower motor is adjusted to a speed which is appropriate for the target rate.

7 - When the demand for high-fire (second stage) heat is satisfied, the gas valve is de-energized and the field-selected indoor blower off delay begins. The combustion air inducer begins a 20-second post-purge period.

8 - When the combustion air post-purge period is complete, the inducer is de-energized. The indoor blower is de-energized at the end of the off delay.

Applications Using a Two-Stage Thermostat

B - Heating Sequence -- Control Thermostat Selection

DIP switch in “Variable Capacity” Position

1 - On a call for heat, thermostat first-stage contacts close sending a signal to the integrated control. The integrated control runs a self-diagnostic program and checks high temperature limit switches for normally closed contacts and pressure switches for normally open contacts. The combustion air inducer is energized at ignition speed, which is approximately the same as the inducer speed at 70 percent firing rate.

2 - Once the control receives a signal that the low-fire pressure switch has closed, the combustion air inducer begins a 15-second pre-purge in low speed.

3 - After the pre-purge is complete, a 20-second initial ignitor warm-up period begins. The combustion air inducer continues to operate at the ignition speed.

4 - After the 20-second warm-up period has ended, the gas valve is energized and ignition occurs. At the same time, the control module begins an indoor blower 30-second ON-delay. When the delay ends, the indoor blower motor is energized at a speed that matches the firing rate. After the 10-second ignition stabilization delay expires, the inducer speed is adjusted to the appropriate target rate. If the furnace is operating in the initial heating cycle after power-up, the initial firing rate will be approximately 35 percent. The firing rate on subsequent cycles will be automatically adjusted by the integrated control based on thermostat cycles. The firing rate will vary and will range from 35 percent to 90 percent. The furnace will continue this operation as long as the thermostat has a first-stage heating demand.

5 - If second-stage heat is required, the thermostat second-stage heat contacts close and send a signal to the integrated control. The integrated control either increases the firing rate to 70 percent (if the current rate is at or below 60 percent) or increases the firing rate by 10 percent (if the current rate is above 60 percent). If the call for heat continues 5 minutes beyond this initial upstage, the rate will be increased by 10 percent every 5 minutes until the call for heat is satisfied or the furnace reaches 100 percent rate. As the firing rate increases, the indoor blower motor is adjusted to a speed which is appropriate for the target rate.

6 - If second-stage heat demand is satisfied, but first stage is still present, the furnace will continue to operate at the present firing rate until the heat cycle ends.

7 - When the demand for first- and second-stage heat is satisfied, the gas valve is de-energized and the field-selected indoor blower off delay begins. The combustion air inducer begins a 20-second post-purge period.

8 - When the combustion air post-purge period is complete, the inducer is de-energized. The indoor blower is de-energized at the end of the off delay.

Applications Using A Single-Stage Thermostat

C - Heating Sequence -- Control Thermostat Selection

DIP switch in “Single-Stage” Position

1 - On a call for heat, thermostat first-stage contacts close sending a signal to the integrated control. The integrated control runs a self-diagnostic program and checks high temperature limit switches for normally closed contacts and pressure switches for normally open contacts. The combustion air inducer is energized at the ignition speed, which is approximately the same as the inducer speed at 70 percent firing rate.

2 - Once the control receives a signal that the low-fire pressure switch has closed, the combustion air inducer begins a 15-second pre-purge at the ignition speed.

3 - After the pre-purge is complete, a 20-second initial ignitor warm-up period begins. The combustion air inducer continues to operate at the ignition speed.

4 - After the 20-second warm-up period has ended, the gas valve is energized and ignition occurs, which initiates a 10-second ignition stabilization delay. At the same time, the control module sends a signal to begin an indoor blower 30-second ON-delay. When the delay ends, the indoor blower motor is energized at a speed which is appropriate for the firing rate. After the 10-second ignition stabilization delay expires, the inducer speed is adjusted to 35 percent speed. The integrated control also initiates a second-stage on delay (factory-set at 7 minutes; adjustable to 12 minutes).
5 - If the heating demand continues beyond the second-stage on delay, the integrated control energizes the combustion air inducer at 70 percent speed. The indoor blower motor is adjusted to a speed which matches the target rate. A fixed, 10-minute third-stage on delay is initiated.

6 - If the heating demand continues beyond the third-stage on delay, the integrated control energizes the inducer at high speed. The indoor blower motor is adjusted to a speed which is appropriate for the target rate.

7 - When the thermostat heating demand is satisfied, the gas valve is de-energized and the combustion air inducer begins a 20-second post-purge. The field-selected indoor blower off delay begins.

8 - When the combustion air post-purge period is complete, the inducer is de-energized. The indoor blower is de-energized at the end of the off delay.

Service

⚠️ WARNING

ELECTRICAL SHOCK, FIRE, OR EXPLOSION HAZARD.

Failure to follow safety warnings exactly could result in dangerous operation, serious injury, death or property damage. Improper servicing could result in dangerous operation, serious injury, death or property damage. Before servicing, disconnect all electrical power to furnace. When servicing controls, label all wires prior to disconnecting. Take care to reconnect wires correctly. Verify proper operation after servicing.

At the beginning of each heating season, system should be checked as follows by a qualified service technician:

Blower
Check the blower wheel for debris and clean if necessary. The blower motors are prelubricated for extended bearing life. No further lubrication is needed.

⚠️ WARNING

The blower access panel must be securely in place when the blower and burners are operating. Gas fumes, which could contain carbon monoxide, can be drawn into living space resulting in personal injury or death.

Filters
All SLP98UHV filters are installed external to the unit. Filters should be inspected monthly. Clean or replace the filters when necessary to ensure proper furnace operation. Table 1 lists recommended filter sizes.

Exhaust and air intake pipes
Check the exhaust and air intake pipes and all connections for tightness and to make sure there is no blockage. NOTE - After any heavy snow, ice or frozen fog event, the furnace vent pipes may become restricted. Always check the vent system and remove any snow or ice that may be obstructing the plastic intake or exhaust pipes.

Electrical
1 - Check all wiring for loose connections.
2 - Check for the correct voltage at the furnace (furnace operating). Correct voltage is 120VAC ± 10%.
3 - Check amp-draw on the blower motor with inner blower panel in place.
   Motor Nameplate __________ Actual __________

Winterizing and Condensate Trap Care
1 - Turn off power to the unit.
2 - Have a shallow pan ready to empty condensate water.
3 - Remove the drain plug from the condensate trap and empty water. Inspect the trap then reinstall the drain plug and refill trap with water.

Cleaning Heat Exchanger
If cleaning the heat exchanger becomes necessary, follow the below procedures and refer to figure 1 when disassembling unit. Use papers or protective covering in front of furnace while removing heat exchanger assembly.
1 - Turn off electrical and gas supplies to the furnace.
2 - Remove the furnace access panels.
3 - Disconnect the 2-pin plug from the gas valve.
4 - Remove gas supply line connected to gas valve. Remove the burner box cover and remove gas valve/ manifold assembly.
5 - Remove sensor wire from sensor. Disconnect 2-pin plug from the ignitor.
6 - Disconnect wires from flame roll-out switches.
7 - Remove four burner box screws at the vestibule panel and remove burner box. Set burner box assembly aside.
   NOTE - If necessary, clean burners at this time. Follow procedures outlined in Burner Cleaning section.
8 - Loosen the clamps to the flexible exhaust coupling.
9 - Disconnect condensate drain line from the cold end header box.
10 - Disconnect condensate drain tubing from flue collar. Remove screws that secures the flue collar into place. Remove flue collar. It may be necessary to cut the exiting exhaust pipe for removal of the fitting.
11 - Mark and disconnect all combustion air pressure tubing from cold end header collector box.
12 - Mark and remove wires from pressure switches. Remove pressure switches. Keep tubing attached to pressure switches.
13 - Disconnect the 4-pin plug from the combustion air inducer. Remove two screws which secure combustion air inducer to collector box. Remove combustion air inducer assembly. Remove ground wire from vestibule panel.
14 - Remove cold end header box.
15 - Remove electrical junction box from the side of the furnace.
16 - Mark and disconnect any remaining wiring to heating compartment components. Disengage strain relief bushing and pull wiring and bushing through the hole in the blower deck.
17 - Remove the primary limit from the vestibule panel.
18 - Remove two screws from the front cabinet flange at the blower deck. Spread cabinet sides slightly to allow clearance for removal of heat exchanger.
19 - Remove screws along vestibule sides and bottom which secure vestibule panel and heat exchanger assembly to cabinet. Remove two screws from blower rail which secure bottom heat exchanger flange. Remove heat exchanger from furnace cabinet.
20 - Back wash heat exchanger with soapy water solution or steam. If steam is used it must be below 275°F (135°C).
21 - Thoroughly rinse and drain the heat exchanger. Soap solutions can be corrosive. Take care to rinse entire assembly.
22 - Reinstall heat exchanger into cabinet making sure that the clamshells of the heat exchanger assembly are resting in the support located at the rear of the cabinet. Remove the indoor blower to view this area through the blower opening.
23 - Re-secure the supporting screws along the vestibule sides and bottom to the cabinet.
24 - Reinstall cabinet screws on front flange at blower deck.
25 - Reinstall the primary limit on the vestibule panel.
26 - Reinstall electrical junction box.
27 - Reinstall the cold end header box.
28 - Reinstall the combustion air inducer. Reconnect the 4-pin plug to the wire harness.
29 - Reinstall pressure switches and reconnect pressure switch wiring.
30 - Carefully connect combustion air pressure switch hosing from pressure switches to proper stubs on cold end header collector box.
31 - Reconnect condensate drain line to the cold end header box.
32 - Use securing screws to reinstall flue collar to the top cap on the furnace. Reconnect exhaust piping and exhaust drain tubing.
33 - Replace flexible exhaust adapter on combustion air inducer and flue collar. Secure using two existing hose clamps.
34 - Reinstall burner box assembly in vestibule area.
35 - Reconnect flame roll-out switch wires.
36 - Reconnect sensor wire and reconnect 2-pin plug from ignitor.
37 - Secure burner box assembly to vestibule panel using four existing screws. Make sure burners line up in center of burner ports.
38 - Reinstall gas valve manifold assembly. Reconnect gas supply line to gas valve.
39 - Reinstall burner box cover.
40 - Reconnect 2-pin plug to gas valve.
41 - Replace the blower compartment access panel.
42 - Refer to instruction on verifying gas and electrical connections when re-establishing supplies.
43 - Follow lighting instructions to light and operate furnace for 5 minutes to ensure that heat exchanger is clean and dry and that furnace is operating properly.
44 - Replace heating compartment access panel.

Cleaning the Burner Assembly
1 - Turn off electrical and gas power supplies to furnace. Remove upper and lower furnace access panels.
2 - Disconnect the 2-pin plug from the gas valve.
3 - Remove the burner box cover.
4 - Disconnect the gas supply line from the gas valve. Remove gas valve/manifold assembly.
5 - Mark and disconnect sensor wire from the sensor. Disconnect wires from flame rollout switches.
6 - Remove four screws which secure burner box assembly to vest panel. Remove burner box from the unit.
7 - Use the soft brush attachment on a vacuum cleaner to gently clean the face of the burners. Visually inspect the inside of the burners and crossovers for any blockage caused by foreign matter. Remove any blockage.
8 - Reinstall the burner box assembly using the existing four screws. Make sure that the burners line up in the center of the burner ports.
9 - Reconnect the sensor wire and reconnect the 2-pin plug to the ignitor wiring harness. Reconnect wires to flame rollout switches.
10 - Reinstall the gas valve manifold assembly. Reconnect the gas supply line to the gas valve. Reinstall the burner box cover.
11 - Reconnect 2-pin plug to gas valve.
12 - Replace the blower compartment access panel.
13 - Refer to instruction on verifying gas and electrical connections when re-establishing supplies.
14 - Follow lighting instructions to light and operate furnace for 5 minutes to ensure that heat exchanger is clean and dry and that furnace is operating properly.
15 - Replace heating compartment access panel.
## Planned Service

A service technician should check the following items during an annual inspection. Power to the unit must be shut off for the service technician’s safety.

- **Burners** - Must be inspected for rust, dirt, or signs of water.
- **Vent pipe** - Must be inspected for signs of water, cracked, damaged or sagging pipe, or disconnected joints.
- **Unit appearance** - Must be inspected for rust, dirt, signs of water, burnt or damaged wires, or components.
- **Blower access door** - Must be properly in place and provide a seal between the return air and the room where the furnace is installed.
- **Return air duct** - Must be properly attached and provide an air seal to the unit.

- **Operating performance** - Unit must be observed during operation to monitor proper performance of the unit and the vent system.
- **Combustion gases** - Flue products must be analyzed and compared to the unit specifications.

Problems detected during the inspection may make it necessary to temporarily shut down the furnace until the items can be repaired or replaced.

**Instruct the homeowners to pay attention to their furnace.** Situations can arise between annual furnace inspections that may result in unsafe operation.

## Repair Parts List

The following repair parts are available through Lennox dealers. When ordering parts, include the complete furnace model number listed on the nameplate -- Example: SLP98UH070V36B. **All service must be performed by a licensed professional installer (or equivalent), service agency, or gas supplier.**

### Cabinet Parts
- Outer access panel
- Blower access panel
- Top cap

### Control Panel Parts
- Transformer
- Integrated control
- Door interlock switch
- Circuit breaker

### Blower Parts
- Blower wheel
- Motor
- Motor mounting frame
- Blower housing cut-off plate

- Power choke (1HP only)

### Heating Parts
- Flame sensor
- Heat exchanger assembly
- Gas manifold
- Combustion air inducer
- Gas valve
- Main burner cluster
- Main burner orifices
- Pressure switches
- Ignitor
- Primary limit control
- Flame rollout switches
**Integrated Control Diagnostic Codes**

Press the diagnostic push button and hold it to cycle through a menu of options. Every five seconds a new menu item will be displayed. Release the button when the desired mode is displayed.

When a solid "P" is displayed, the furnace capacity/size is programmed.

When the solid "E" is displayed, the control enters the Error Code Recall mode. Error Code Recall mode menu options: No change (displaying error history) remains in Error Code Recall mode; solid "b" exits Error Code Recall mode; and solid "c" clears the error history. Must press button while flashing "c" is displayed to clear error codes.

When the solid "-" is displayed, the control enters the Field Test mode. Field Test mode menu options: Solid "C" starts pressure switch calibration; blinking "-" exits Field Test mode.

</tbody>
</table>
Configuring Unit Size Codes

**Power-Up** - Number displayed represents by integrated control unit size code (furnace model and capacity). If three horizontal bars are displayed followed by continuous E203, furnace control does not recognize unit size code. Configure per the following:

1. Furnace control in **IDLE** mode (No heating, cooling or indoor fan operation).
2. Turn room thermostat to **OFF**.
3. Push and hold button until the solid **P** symbol is displayed on the 7-segment LED. Release button. This mode allows the user to select a unit size code number that matches the furnace model size and capacity.
4. If alarm is present, furnace control will display error code. If alarm is not present solid **dash** starts blinking on 7-segment LED display.
5. Push and hold button until the solid **P** symbol is displayed on the 7-segment LED. Release button. **IMPORTANT**: Field replacement controls may need to be manually configured to validate furnace unit size code.
6. Solid **P** starts blinking on 7-Segment LED.
7. Push and hold button. Integrated control will display unit size code number for each furnace model for five seconds.

**UNIT SIZE CODE**

<table>

<td>SLP98UHV-135-60D</td>
</tr>
</tbody>
</table>

When the correct unit size code is displayed, release button. Selected code will flash for 10-second period. During that period, hold push button until code stops blinking (disappear for 2 seconds). Integrated control will store code in memory and will automatically exit Field Test Mode and reset. If second period expires or push button is held less than five seconds, control will automatically exit Field Test Mode and go into IDLE mode without storing unit size code. If this happens, programming function must be repeated.

Verify that the selected unit size code is correct and stored in non-volatile memory by cycling the 24 volt power to the furnace control. (At 24 volt power-up of the furnace control, the 7-segment LED will display a unit size code. If three horizontal bars display, board does not recognize unit size code. Programming function must be repeated.

FINISHED
IGNITION AND CALL FOR LOW FIRE WITH TWO-STAGE THERMOSTAT

1. Safety Check
   - Verify There Is No Main Burner Flame
   - Limit Switch Closed?
     - NO: De-Energize Gas Valve
     - YES: Indoor Blower OFF After Heat OFF Delay (Low Heat Speed)
   - Rollout Circuit Closed?
     - NO: De-Energize Gas Valve
     - YES: Indoor Blower OFF After Heat OFF Delay (High Heat Speed)
   - Low Pressure Switch Open?
     - NO: Error Code Flashes
     - YES: Indoor Blower ON (70%)
   - Low Pressure Switch Opens
     - YES: Calibrations Attempted?
       - 0: Calibration Successful
       - 1: Calibrations Attempted
         - YES: Soft Lockout: Error Code Flashes
         - NO: Call For Heat?
   - Pre-Purge 15 Seconds
   - Ignitor ON 20 Seconds
   - Gas Valve Energized
   - Ignition Trial Begins (Ignitor ON)
   - Indoor Blower Delay Timer Started
   - Flame Sensed Within 4 seconds?
     - NO: Gas Valve De-energized
     - YES: Ignitor OFF
   - Ignitor OFF
   - Wait For Ignition Stabilization Delay
   - Set Target Firing Rate Based on Thermostat Signals Present

2. OR
   - Call For 1st Stage Heat
   - Indoor Blower OFF After Heat OFF Delay (High Heat Speed)
   - Combustion Air Inducer OFF at 70% Rate Speed
   - Low Pressure Switch Open
   - combustion air inducer close
   - Indoor Blower OFF (70%)
   - Rollout Circuit Close
   - YES: Error Code Flashes
   - NO: Indoor Blower OFF After Heat OFF Delay (High Heat Speed)

3. Call For 2nd Stage Heat
   - Indoor Blower OFF After Heat OFF Delay (High Heat Speed)
   - Combustion Air Inducer OFF at 70% Rate Speed
   - Low Pressure Switch Open
   - combustion air inducer close
   - Indoor Blower OFF (70%)
   - Rollout Circuit Close
   - YES: Error Code Flashes
   - NO: Indoor Blower OFF After Heat OFF Delay (High Heat Speed)

4. Call For Heat Satisfied
   - Indoor Blower OFF After Heat OFF Delay (High Heat Speed)
   - Combustion Air Inducer OFF at 70% Rate Speed
   - Low Pressure Switch Open
   - combustion air inducer close
   - Indoor Blower OFF (70%)
   - Rollout Circuit Close
   - YES: Error Code Flashes
   - NO: Indoor Blower OFF After Heat OFF Delay (High Heat Speed)

5. SOFT LOCKOUT IS RESET AUTOMATICALLY AFTER ONE HOUR WITH A CALL FOR HEAT ACTIVE, OR BY CYCLING THE CALL FOR HEAT, OR BY CYCLING POWER TO THE CONTROL.
   - HARD LOCKOUT IS RESET BY CYCLING POWER TO THE CONTROL.
Troubleshooting: Heating Sequence of Operation (Continued)

CALL FOR HIGH FIRE WITH TWO-STAGE THERMOSTAT

1. 2 Stage Thermostat
2. 1st Call for High Fire?
   - YES
   - NO
3. 2nd Stage Recognition Delay (30 Seconds)
4. Combusion Air Inducer ON (100% Rate Speed)
5. High Pressure Switch Closes Within 10 Seconds?
   - YES
   - NO
6. Adjust Indoor Blower to Appropriate speed
7. 3A Wait for Call for Heat Satisfied

⚠️ System will always light at 70% even if 2nd stage call for heat is in place
⚠️ If the high pressure switch does not close within 5 attempts, the system will operate at low fire for the remainder of the call for heat at request
CALL FOR HEAT SATISFIED

RUN MODE (TWO-STAGE THERMOSTAT)
FIRST OR SECOND-STAGE CALL FOR HEAT
ALL INPUTS MONITORED (LIMIT, PRESSURE,
CALL FOR HEAT/COOL, FLAME LEVEL).

2nd Stage Heat

- NO

2nd Stage Call for Heat satisfied?

YES

Combustion Air Inducer switched to 70% rate speed

Adjust Indoor Blower to appropriate speed

1st Stage Heat

- NO

1st Stage Call for Heat satisfied?

YES

Gas valve De-Energized

Combustion Air Inducer OFF after 20-Second Post Purge

Indoor Blower OFF after OFF Delay

1 OR 4

Wait for Call Two-Stage Thermostat

Wait for Call Single-Stage Thermostat

RUN MODE (SINGLE-STAGE THERMOSTAT)
ALL INPUTS MONITORED (LIMIT, PRESSURE,
CALL FOR HEAT/COOL, FLAME LEVEL).
IGNITION AND CALL FOR HEAT WITH SINGLE-STAGE THERMOSTAT

Troubleshooting: Heating Sequence of Operation (Continued)

1. Wait for Ignition Stabilization Delay
2. Set to Low Firing Rate
3. Move to Mid Firing Rate and High Firing Rate after 2nd and 3rd Stage Delays (based on DIP Switch selections)
4. Safety Check
   - Verify there is no Main Burner Flame
   - Limit Switch Closed?
     - NO: De-Energize Gas Valve
     - YES: Combustion Air Inducer ON (100%)
   - Rollout Circuit Closed?
     - NO: De-Energize Gas Valve
     - YES: Indoor Blower ON (100% Speed)
   - Low Pressure Switch Open?
     - NO: Error Code Flashes After 5 Seconds
     - YES: Low Pressure Switch Open
   - Low Pressure Switch Closed Within 150 Seconds?
     - NO: Pressure Switch Calibration
     - YES: Combustion Air Inducer ON at Ignition at 70% rate speed
   - Pre-Purge 15 Seconds
   - Ignition Trial Begins
     - Flame Sensed Within 4 seconds?
       - NO: Gas Valve De-energized
       - YES: Gas Valve Energized
     - Ignitor ON 20 Seconds
     - Indoor Blower On Delay Timer Started
     - Interpurge (15 Seconds)
   - 5th Unsuccessful Trial?
     - NO: Post-Purge (20 Seconds)
     - YES: Combustion Air Inducer OFF
   - Soft Lockout Error Code Flashes
   - Hard Lockout Error Code Flashes
   - Wait 5 minutes
   - Soft Lockout is reset automatically after one hour with a Call for Heat active, or by cycling the Call for Heat, or by cycling power to the control.
   - Hard Lockout is reset by cycling power to the control.

3B. Call For Heat Satisfied
Troubleshooting: Cooling Sequence of Operation

CALL FOR COOLING

1st Stage Cooling Request Received

Energize 1st Stage Cooling Contactor (Compressor & Fan)

Indoor Blower On After 2-second delay

Energize Indoor Blower (Per Ramping Profile)

2nd Stage Cooling Request?

YES

Energize 2nd Stage Cooling Contactor (Compressor & Fan)

2nd Stage Cooling Request Still Active?

YES

Maintain Indoor Blower (High Cooling mode)

NO

De-Energize 2nd Stage Cooling Contactor (Compressor & Fan)

1st Stage Cooling Request Still Active?

YES

Energize and Maintain Indoor Blower at Low Cooling mode

NO

De-Energize 1st Stage Cooling Contactor (Compressor & Fan)

De-Energize Indoor Blower Per Ramping Profile

2nd stage cooling operation requires a 2-stage thermostat, a 2-stage cooling system and on-board link W915 must be be cut. The control will not respond to a 2nd stage cooling request unless a 1st stage cooling request is active.

Indoor blower cooling mode and high cooling mode have a specific ON, OFF and speed ramping profiles. The specific profile is selected using the DIP switches on the control.
CONTINUOUS LOW SPEED INDOOR BLOWER SEQUENCE OF OPERATION

- **Call for Continuous Blower**
  - **Indoor Blower On** (Speed Determined by Dip Switch settings)
  - **Request for Cooling Received?**
    - **YES** → **Maintain Indoor Blower at set speed** → **Go to Call for Cooling**
    - **NO**
  - **Request for Heat Received?**
    - **YES** → **Maintain Indoor Blower at set speed** → **Go to Call for Heat -- Two-Stage Thermostat**
    - **OR**
    - **4** → **Go to Call for Heat -- Single-Stage Thermostat**
  - **Call for Fan Removed?**
    - **NO** → **Maintain Indoor Blower at set speed**
    - **YES** → **De-Energize Indoor Blower Per Ramping Profile**

⚠️ Indoor blower low cooling mode and high cooling mode, have specific ON - OFF and speed ramping profiles. The specific profile is selected using the dip switches on the control.
Revised NFPA-54 section 10.8.3 to add the following requirements:

For all side wall, horizontally vented, gas-fueled equipment installed in every dwelling, building or structure used in whole or in part for residential purposes, including those owned or operated by the Commonwealth and where the side wall exhaust vent termination is less than seven (7) feet above the finished grade in the area of the venting, including but not limited to decks and porches, the following requirements shall be satisfied:

1 - INSTALLATION OF CARBON MONOXIDE DETECTORS. At the time of installation of the side wall, horizontally vented, gas-fueled equipment, the installing plumber or gasfitter shall observe that a hard-wired carbon monoxide detector with an alarm and battery backup is installed on the floor level where the gas equipment is to be installed. In addition, the installing plumber or gasfitter shall observe that a battery-operated or hard-wired carbon monoxide detector with an alarm is installed on each additional level of the dwelling, building or structure served by the side wall, horizontally vented, gas-fueled equipment. It shall be the responsibility of the property owner to secure the services of qualified licensed professionals for the installation of hard-wired carbon monoxide detectors.

a - In the event that the side wall, horizontally vented, gas-fueled equipment is installed in a crawl space or an attic, the hard-wired carbon monoxide detector with alarm and battery back-up may be installed on the next adjacent floor level.

b - In the event that the requirements of this subdivision cannot be met at the time of completion of installation, the owner shall have a period of thirty (30) days to comply with the above requirements; provided, however, that during said thirty (30) day period, a battery-operated carbon monoxide detector with an alarm shall be installed.

2 - APPROVED CARBON MONOXIDE DETECTORS. Each carbon monoxide detector as required in accordance with the above provisions shall comply with NFPA 720 and be ANSI/UL 2034 listed and IAS certified.

3 - SIGNAGE. A metal or plastic identification plate shall be permanently mounted to the exterior of the building at a minimum height of eight (8) feet above grade directly in line with the exhaust vent terminal for the horizontally vented, gas-fueled heating appliance or equipment. The sign shall read, in print size no less than one-half (1/2) inch in size, “GAS VENT DIRECTLY BELOW. KEEP CLEAR OF ALL OBSTRUCTIONS.”

4 - INSPECTION. The state or local gas inspector of the side wall, horizontally vented, gas-fueled equipment shall not approve the installation unless, upon inspection, the inspector observes carbon monoxide detectors and signage installed in accordance with the provisions of 248 CMR 5.08(2)(a) 1 through 4.

EXEMPTIONS: The following equipment is exempt from 24 CMR 5.08(2)(a) 1 through 4:

1 - The equipment listed in Chapter 10 entitled “Equipment Not Required to Be Ventured” in the most current edition of NFPA 54 as adopted by the Board; and

2 - Product Approved side wall, horizontally vented, gas-fueled equipment installed in a room or structure separate from the dwelling, building or structure used in whole or in part for residential purposes.

MANUFACTURER REQUIREMENTS - GAS EQUIPMENT VENTING SYSTEM PROVIDED.

When the manufacturer of Product Approved side wall, horizontally vented, gas-fueled equipment provides a venting system design or venting system components with the equipment, the instructions provided by the manufacturer for installation of the equipment and the venting system shall include:

1 - Detailed instructions for the installation of the venting system design or the venting system components: and

2 - A complete parts list for the venting system design or venting system.

MANUFACTURER REQUIREMENTS - GAS EQUIPMENT VENTING SYSTEM NOT PROVIDED.

When the manufacturer of Product Approved side wall, horizontally vented, gas-fueled equipment does not provide the parts for venting the flue gases, but identifies “special venting systems,” the following requirements shall be satisfied by the manufacturer:

1 - The referenced “special venting system” instructions shall be included with the appliance or equipment installation instructions; and

2 - The “special venting systems” shall be Product Approved by the Board, and the instructions for that system shall include a parts list and detailed installation instructions.

A copy of all installation instructions for all Product Approved side wall, horizontally vented, gas-fueled equipment, all venting instructions, all parts lists for venting instructions, and/or all venting design instructions shall remain with the appliance or equipment at the completion of the installation.
